

Apicurio Studio es una suite de diseño de API basada en la web, creada principalmente (pero no exclusivamente) para admitir el desarrollo de **API REST** que prioriza el diseño. Proporciona una forma para que los usuarios diseñen de forma colaborativa y visual sus API antes (o al mismo tiempo) de la implementación.

What is Apicurio Studio?

Apicurio Studio is a web based API Design suite, primarily (but not exclusively) built to support design-first REST API development. It provides a way for users to collaboratively and visually design their APIs prior to (or concurrent with) the implementation.

Key Features

- Web Based**
Design your **OpenAPI** APIs in a web (browser based) application - no installation necessary.
- Code-optional Design**
Don't know the **OpenAPI specification** inside and out? Now you don't have to!
- Open Source**
The Apicurio Studio is fully **open source**, hosted on **GitHub** and actively maintained.

Diseño de una API

The screenshot displays the Apicurio API editor interface. On the left sidebar, there are navigation options: Dashboard, APIs, and Settings. The main editor area shows the API configuration for the endpoint `/employee-directory-entry/personal-information/retrieve`. The HTTP method is set to `Get`. Under `HEADER PARAMETERS (2)`, there are two parameters: `application-id` and `transaction-id`, both of type `string` and marked as `[required]`. The `REQUEST BODY` section contains a warning: `Not Recommended It is unusual and not recommended to define a request body for a GET operation.` The `RESPONSES (1)` section shows a `200 OK` response with a description and a response type of `RetrieveEmployeeDirectoryEntryPersonallInformationResponseObject`.
